TITLE : DISTRIBUTING COORDINATE SPACE  
CONFIGURATION METHOD AND  
SYSTEM

ABSTRACT : PROBLEM TO BE SOLVED: To deform and add an object in system operation by adding or revising definition information of a virtual object down-loaded from a server at a terminal equipment and transferring the definition information to other terminal equipment.

SOLUTION: Information given from an edit control section 105 is interpreted by a script interpreter 102 into image information and part of information of a translated local database 104 is displayed on a monitor 107. The user operates a mouse 108 to designate a position and a shape and a type of material of a virtual object thereby generating a new virtual object. The information of the generated virtual object is given to an edit control section 105, in which definition of an information structure is edited and stored in the local database 104. When the edit is finished, the revised part in the local database 104 is fed to a server 200 via a communication control section 101 and stored in a global database 201. Furthermore, terminal equipment 100 transfers the content stored in the global database 201 to other terminal equipment.
